An isolated nucleic acid molecule for the treatment of angiogenesis-

```
The present invention provides the protein and coding sequences of canine pro-endostatin and endostatin. The sequences can be used in the treatment and diagnosis of angiogenesis related disorders, including cancer, rheumatoid arthritis, psoriasis, retinopathy, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, osler webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, hemophiliac joints, angiofibroma, wound granulation, coronary collaterals, cerebral collaterals, necessularisation, and fractures. The present sequence is the canine endostatin coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         540
                                                                                                                                                                                                                                                                                                                                                                                                                             120
                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

The sequences can be used in the treatment and diagnosia of angiogenesis related disorders, including cancer, rheumatoid arthritis, postiasis, retinopathy, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasis, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, coronary collaterals, cerebral collaterals, necessatian anteriovenous malformations, ischaemic limb angiogenesis, diabetic neovascularisation, and fractures. The present sequence is the canine pro-endostatin coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Novel fusion protein of angiostatin or endostatin and an immunoglobulin FC region, useful for treating conditions mediated by angiogenesis, such

The patent discloses a DNA molecule encoding a fusion protein comprising a signal sequence, an immunoglobulin Fc region, and an angiogenesis inhibitor selected from angiotatin, a plasminogen fragment activity, a collagen XVIII fragment having endostatin activity, or combinations of them. The fusion protein (immunofusin) is cused to inhibit angiogenesis and to treat diseases or conditions mediated by angiogenesis. Conditions that may be treated include solid tumours, blood born tumours, tumour metastasis, benign tumours including hammangiomas, accusic neuromas, neurofilpromas, trachomas and pyrogenic granulomas, rheumatoid arthritis, psoriasis, ocular angiogenic diseases e.g. diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibrache neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, and excessive or abnormal stimulation of endothelial cells, intestinal cells, atherosclarosis, sclerodermal and hypertrophic scars, i.e. keloid scars. The DNA constructs may be used in gene therapy. The present sequence is a DNA encoding canine endostatin ö 180 240 120 180 9 1 CACACCCACCAGGACTTCCAGCCGGTGCTGCACCTGGTGGCCCTGAACAGCCCGGAGCCG GGGCTGGCCGGCCTTCCGGGCCTTCCTGTCGCGGCTGCAGGACCTCTACAGCATC GGGCTGGCCGGCCATCCGGGCCTTCCTGTCGTCGCGGGCTGCAGGACCTCTACAGCATC GTGCGCCGCGCGCACCGCGCTGCCCCGTCGTCAACCTCAGGGACGAGGTGCTCTTC 1 CACACCCACCAGGACTTCCAGGTGGTGCTGCAGCCTGGTGGCCCTGAACAGCCCGCAGCCG Gaps .; 0 Query Match

The novel factor is derived from endostatin (using PCR to screen a human foetal kidney cell cDNA library) and human IgGIPC. The product of the invention can specifically inhibit tumour vascular endostablial proliferation and can be used for curing several tumour types. This sequence encodes a fusion construct composed of human endostatin and human IgGIPC, described in the disclosure of the invention

```

```
The present sequence encodes an endostatin protein which is the carboxy terminal protein of human collagen XVIII. Recombinant mouse endostatin (20 mg/kg) was administered subcutaneously to mice implanted with Lewis (10 mg/kg) was administered subcutaneously to mice implanted with Lewis care in a carcinomas. There was tumour mass regression non-detectable levels after 12 days of therapy due to the angiogenesis inhibitory activity of endostatin. Thus the protein is useful for treatment of angiogenesis.

CC endostatin are useful for treating and diagnosis of tumours, ocular protein are useful for treating and diagnosis of tumours, ocular plaque neovascularisation, telanglectasia, haemophiliac joints, angiogenic diseases, osler-Webber Syndrome, myocardial angiogenesis, cangiofibroma and wound granulation of endothelial cells e.g. intestinal adhesions, atherosclerosis, scleroderma. The protein may also be useful case a birth control agent by reducing or preventing uterine vascularisation. The gene for endostatin may be isolated from cells, by the name of the mRNA using reverse transcriptase and then amplifying the man anglifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120

This invention describes a novel viral gene therapy vector comprising a nucleic acid molecule encoding an anti-angiogenic polypeptide chosen from human or murine and soft and angiogenesis-inhibiting fusions and fragments, where the viral vector is sufficiently attenuated for use in human gene therapy. The products of the invention activity. The vector is used in gene therapy for inhibiting tumour growth in humans harbouring a solid tumour. The vector expresses an anti-angiogenic polypeptide. An additional use comprises treatment of diabetic retinopathy, where the anti-angiogenic polypeptide inhibits angiogenesis in the victinity of the retina. The vector is administered to cells exvivo and then administered to the patient

The present invention also describes: (1) preparation of (1) and its derivative; (2) an IAF binding acceptor and its preparation; and (3) an IAF antibody. (I) is useful for preparing new biological preparations for effectively treating various tumours and abnormal-vessel diseases. The IAF antibody is preferably a polyclonal antibody, mosaic antibody, single stranded antibody and human originated 9 Angiogenesis inhibiting factor 1 and its derivative useful for treating 1 CACACCCACCAGGACTTCCAGCTGGTGCTGCACCTGGTGGCCCTGAACAGCCCGCAGCCG CCCAGCTGGGAGGCCTTATTCTCGGGCTCCGAGGGCCAGCTGAAGCCCCGGGGCCCGCATC cciadoridesakosororieriroridadestroriadesirosecitadadescondesiones TTCTCTTTCGACGGCAGAGATGTCCTGCAGCACCCCGGCCTGGCCCCGGGAGGCGTGTGG trerectricalescalasacirectasaseaciaeceaeciaseceaeciaseaceasas CACGGCTCCGACCGCGCGCGCCTGACCGACAGCTACTGCGAGACGTGCGAACG GAGGCCCCGGGCCACCGGGCAGGCGTCGCTGCTGGCGGGGCAGGCTGCTGGAGCAG GGGCTGGCCGGCCTTCCGGGCCTTCCTGTCGTCGCGGCTGCAGGACCTCTACAGCATC | descrete de de la contracta del la contracta de la contracta de la contracta de la contracta GTGCGCCGCCGACCGCACCGGGGTGCCCGTCGTCAACCTCAGGGACGAGGTGCTCTTC eecescarecessaricescesesceacratrocasiscratecasecaseceses Gaps Human, anglogenesis inhibiting factor 1; IAF-1; tumour; antibody; abnormal vessel disease; ss. . 0 75.3%; Score 418; DB 3; Length 549; llarity 85.3%; Pred. The sequence encodes Human Endostatin(TM). The new method of the invention is useful for producing, recovering and purifying Endostatin (TW) from biological sources, such as biological fulles, issues, cells, culture media, and fermentation media. Endostatin(TM) is useful for treating anglogenesis mediated diseases such as solid tumours, blood treating anglogenesis mediated diseases benign tumours, blood borne tumours, leukaemias, tumour metastases, benign tumours, blood constitution is neurofibromas, rachomas, and pyogenic granulomas, rheumatoid arthritis, psoriaais, centar anglogenic diseases, of diabetic retinopathy, retinopathy of prematurity, macular of granulomas, rheumatoid arthritis, psoriaais, coular anglogenic diseases, of e.g., diabetic retinopathy, retinopathy of psecuriar glaucoma, colon cancer, retrolental fibroplasia, rubbosis, Osler-Webber Syndrome, myocardial anglogenesis, plaque neovascularisation, telangiectasia, myocardial anglogenesis, plaque neovascularisation, telangiectasia, con a subobhiliac joines, anglofibroma, and wound granulation. Endostatin(TW) is also useful for treating disease of excessive or abnormal stimulation of endothelial cells such as intestinal adhesions, atherosclerosia, colon is also subjected to lyophilisation, while preserving biological activity. Centrifugation of broth from fermentation steps in production is avoided, colon additional proteins, plaments, enzymes and other cellular cellular said and other cellular cellular said and other cellular said other cellular said other cellular said of the cellular said of the cellular said of the cellular said other cellular said other cellular said other cellular said other cellular said other cellular said other cellular said other cellular said other cellular sa Producing Endostatin protein for treating angiogenesis mediated diseases such as solid tumors, comprises recombinantly producing the protein using an expression system, and recovering and purifying the protein. This sequence encodes endostatin. Endostatin is a 20 kD C-terminal fragment of collagen XVIII that inhibits angiogenesis. The endostatin coding sequence may be used in the recombinant viral vector of the invention for obtaining angiostatin activity. The vector comprises a promoter capable of expressing human angiostatin operably linked to a structural gene encoding one or more domains of human angiostatin. The ector, which may be a replication-defective viral vector, is useful for inhibiting angiogenesis in a mammal, especially with cancer or a tumour. Note: This sequence is given incorrectly in the sequence listing of the specification as an amino acid sequence Example 4; Page 80-82; 83pp; English.

combinations of angiostatin, endostatin, interferon, thrombospondin, interferon-inducible protein and platelet factor 4, and have anti-angiogenic and/or anti-tumor activity. The multifunctional protein may exhibit useful properties such as having similar or greater biological activity when compared to a single factor or by having improved half-life or decreased adverse side effects, or a combination of these properties. The proteins can be used for treating an angiogenic-mediated disease, e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis. They can also be used for inhibiting the production of tumor cells (characteristic of lung, breact, ovarian, protected, pancreatic, gastric, colon, renal, bladder cancers; melanoma, hepatoma, sarcoma and lymphomal in a patient and for inhibiting tumor growth. The present sequence is used in the course of the invention

This invention relates to angiogenesis-inhibiting protein receptors, and the DNA sequences encoding them. Angiogenesis is the generation of new blood vessels into a tissue, and normally occurs in wound healing, foetal and embryonal development and the formation of the corpus luteum, endometrium and placenta. Angiostatin is a protein (see AAB16450 and AAA68202) involved in angiogenesis, and has an amino acid sequence similar to that of a plasminogen fragment (see murine plasminogen fragment (see MAB16451 and AAB1640). Angiostatin has the ability to inhibit angiogenesis. AAA68203). Sequences AAA66422 and AAB16522 represent coding and protein cand some of the peptides AAB16422 and AAB16522 represent coding and protein, and some of the peptides of the invention share homology with regions of laminin. Peptides AAB16422 = B16521 (excluding AAB16490) are the canding sprotein receptor fragments of the invention. The peptides bind either angiostatin or endostatin and can be used in methods for treating diseases and processes that are mediated by angiogenesis, creating diseases and processes that are mediated by angiogenesis, cuch as solid tumours, psoriasis, soleroderma, mycocardial angiogenesis, telicopater relinopathy, arthritis, wound healing, peptic ulcers, Helicobacter related diseases, fractures, placentation and cat scratch fever. They are useful for the detection and prognosis of cancer. DNA sequences A628204-A628241 encode the peptides of the invention

The present sequence encodes human endostatin. The protein is expressed in Streptomyces. Leader sequences of Streptomyces sp. strain C5 SnpA and S. venezuelae alpha-amylase proteins are linked to the N-terminal of endostatin. This ensures that endostatin protein is praduced as a secreted, soluble protein which needs no refolding, is stable in the fermentation broth and is produced in large quantities. The method is used for preparing soluble recombinant human, murine or primate endostatin, which is useful in the treatment of cancer, inhibition of 360 420 420 480 480 540 540 360 Preparation of soluble recombinant endostatin involves transforming Streptomycete host with expression vector comprising nucleotide sequence encoding endostatin operably linked to linker and leader peptide. tumour growth, inhibition of angiogenesis, isolation of receptors for endostatin and for identification of anti-angiogenic compounds in assays. The endostatin protein is produced as a secreted, soluble protein which needs no refolding, is stable in the fermentation broth and is produced in large quantities. Streptomycetes are amenable for cultivation in large fermentations allowing for large quantities of soluble endostatin to be
                                                                                                                                                                                                                                                                             120
                                                                                                                                                                                                                                                                                                                                              180

```
The present invention provides endostatin peptides which can be used in the modulation of angiogenesis. This is useful in the treatment of cancers, inflammation, rheumatoid arthritis, chronic articular rheumatism, psoriaels, disorders associated with inopportune invasion of prematurity, macular degeneration, conneal graft rejection, retrolental fibroplasia, rubeosis, capillary proliferation in atherosclerotic plaques and osteoporosis. Other angiogenesis-dependent diseases include Osler-Webber syndrome, "wycardial angiogenesis, plaque neovasculisation, telangiectasia, haemophiliac joints and wound granulation. In addition, the peptides can be used as birth control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 GGCGGCATGCGGGGCGGCGGGCTTCCAGTGCTTCCAGCAGGCGGGGCCGTG 120

The present invention relates to methods and compositions of inhibiting angiogenesis. The method comprises administering to a human or animal a composition comprising a protein that is homologous to PITSIRE protein. Kinases (PK) and an angiogenic factor. The method is useful for regulating angiogenic factor. The method is useful for degeneration, and diabetic retinopathy. The compositions are useful in treating diseases The method and compositions are inhibiting angiogenic related diseases. The method and compositions are useful in treating diseases and processes that are mediated by angiogenesis including haemangioms, solid tunnours, blood borne tumours, leukaemia, metastasis, telangiectasia, psoriasis, solid tumours, blood borne tumours, cunnoma, myocardial angiogenesis, Crohn's disease, plaque neovascularisation, coronary collaterals, cerebral collaterals, arteriovenous malformations, isolatemic limb angiogenesis, cornal collaterals, certolental fibroplasia, arthritis, diabetic retinopathy.

Tetrolental fibroplasia, arthritis, diabetic retinopathy actures, keloids, vasculogenesis, hemmatopoiesis, ovulation, mecular degeneration, wound healing, peptic ulcer, Helicobacter related diseases, fractures, keloids, vasculogenesis, hemmatopoiesis, ovulation, mentruation, provides a therapy for cancer that has minimal side effects.

The present sequence encodes human endostatin which is used to generate
